

Apple DESKTOP FAMILY TREE

Width of desktop and server family branches correlates to the unit's value score. Valuation determined by the computer's processing power per dollar spent in original purchase price. The resultant ratio is weighted relative to other models in a given financial quarter. No purchasing advice intended.

Unit specification information gathered using the MacTracker application for OS X and iOS by the Icon Factory and Ian Page and from Apple's online store using the WayBack Machine internet historical archive engine. Valuation data dependant upon GeekBench processor scores, available from Primate Labs at primatelabs.com/geekbench/. Value score computations performed in Numbers for Mac by Connor Mason.
